## This Exam Includes Three Exercises. It Is Inscribed on 4 Pages Numbered From 1 to 4. The Use of A Non-programmable Calculator is Allowed.

## Answer The Three Following Exercises:

## First Exercise (7 points) Acid-Base Reaction

The label of a bottle containing a commercial hydrobromic acid solution shows, among others, the following indications:

$$
46 \% \text { by mass of } \mathrm{HBr} ; \quad \text { density: } 1.47 \mathrm{~g} \cdot \mathrm{~mL}^{-1}
$$

The aim of this exercise is to perform an acid-base study of a dilute aqueous hydrobromic acid solution.

Given:

$$
\begin{array}{lc}
- & \mathrm{M}(\mathrm{HBr})=81 \mathrm{~g} \cdot \mathrm{~mol}^{-1} \\
- & \mathrm{pKa}\left(\mathrm{NH}_{4}^{+} / \mathrm{NH}_{3}\right)=9.2 \\
\hline
\end{array}
$$

## 1- Dilution of the Commercial Solution

1.1- Show that the molar concentration of the commercial solution is $\mathrm{C}_{0}=8.35 \mathrm{~mol} . \mathrm{L}^{-1}$.
1.2- Describe the experimental procedure to be followed in order to prepare 1 L of a solution (S) by diluting the commercial solution 200 times .
1.3- The pH of the solution ( S ) is equal to 1.38
1.3.1- Show that HBr is a strong acid.
1.3.2- Write the equation of its reaction with water.

## 2- Titration of an Aqueous Ammonia Solution.

The solution (S) is added, progressively, into a beaker containing a volume $\mathrm{V}_{\mathrm{b}}=10.0 \mathrm{~mL}$ of an ammonia solution $\left(\mathrm{NH}_{3}\right)$ of concentration $\mathrm{C}_{\mathrm{b}}$, in the presence of an appropriate colored indicator. The volume of the acid added to reach equivalence is $\mathrm{V}_{\mathrm{aE}}=12 \mathrm{ml}$
2.1- Write the equation of the titration reaction.
2.2- Justify, based on the chemical species present at equivalence, the acid character of this medium.
2.3- Show that the concentration of the ammonia solution is $\mathrm{C}_{\mathrm{b}}=5.0 \times 10^{-2} \mathrm{~mol} \cdot \mathrm{~L}^{-1}$.
2.4- Calculate the volume of ammonia gas needed to prepare 1 L of the ammonia solution of concentration $\mathrm{C}_{\mathrm{b}}$, knowing that the molar volume of a gas is $\mathrm{V}_{\mathrm{m}}=24 \mathrm{~L} \cdot \mathrm{~mol}^{-1}$.

## 3- Preparation of a Buffer Solution

Determine the volume $V_{1}$ of the solution ( S ) that should be added to a volume $\mathrm{V}_{2}=50 \mathrm{~mL}$ of the ammonia solution of concentration $\mathrm{C}_{\mathrm{b}}$ in order to prepare a buffer solution of $\mathrm{pH}=9.0$

## Second Exercise (6 points) <br> Synthesis of an Ester

Available are two flasks: one containing glacial (pure) ethanoic acid and the other contains a liquid of a pure saturated noncyclic chain organic compound (A).
The aim of this exercise is to identify the organic compound (A) then to study its reaction with ethanoic acid.

## 1- Identification of the Family of (A)

In order to identify the chemical family of the compound (A), the experiments listed below are carried out:

| Number of the <br> experiment | Experiment | Result of the experiment |
| :---: | :--- | :--- |
| 1 | (A) + sodium metal | Hydrogen gas release. |
| 2 | Heating a mixture of : <br> (A)+ thionyl chloride $\left(\mathrm{SOCl}_{2}\right)$ | Formation of an organic compound (B) <br> accompanied with the release of two <br> gases. |

Moreover, a study of the compound (B) shows that the molecule of the compound (B) contains only carbon, hydrogen and chlorine.
1.1- Interpret the result of experiment 1.
1.2- Deduce from the experiment 2, the possible chemical families of the compound (B).
1.3- Show that the compound (A) is an alcohol of general formula $\mathrm{C}_{\mathrm{x}} \mathrm{H}_{2 \mathrm{x}+2} \mathrm{O}$.

## 2- Esterification Reaction

A mixture of 0.5 mol of ethanoic acid and a volume V of the compound A is heated. At equilibrium, a quantity of 0.3 mol of an ester E of molecular formula $\mathrm{C}_{5} \mathrm{H}_{10} \mathrm{O}_{2}$ is obtained.

Given: $\begin{aligned} & \text { - Density of the liquid } \mathrm{A} \text { is } \mathrm{d}=0.78 \mathrm{~g} \cdot \mathrm{~mL}^{-1} . \\ & \text { - Molar atomic mass in } \mathrm{g} \cdot \mathrm{mol}^{-1}: \mathrm{M}(\mathrm{H})=1 ; \mathrm{M}(\mathrm{O})=16 \text { and } \mathrm{M}(\mathrm{C})=12 . \\ & \text { - The equilibrium constant } \mathrm{K}, \text { associated with the equation: } \\ & \mathrm{RCOOH}_{(\mathrm{l})}+\mathrm{R}^{\prime} \mathrm{OH}_{(\mathrm{l})} \rightleftarrows \mathrm{RCOOR}_{(\mathrm{l})}^{\prime}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})}\end{aligned}$
is equal to 4.12 if the alcohol is primary and to 2.25 if the alcohol is secondary.
2.1- Determine the molecular formula of the alcohol (A).
2.2- Write the possible condensed structural formulas of the ester (E).
2.3- Calculate the volume V of the compound (A) that should be used so that the initial mixture of the acid and the alcohol is equimolar.
2.4- Show that the equilibrium constant of the equilibrium realized previously is equal to 2.25
2.5- Identify the alcohol (A) and name the ester (E).
2.6- The previous study is carried out again but with one change: the ethanoic acid is replaced with ethanoic anhydride.
Calculate the mass of the ester (E) obtained in this case.

## Third Exercise (7 points) <br> Oxidation of Iodide Ions

A solution (S) is prepared by mixing a volume 100 mL of a potassium iodide solution $\left(\mathrm{K}^{+}+\mathrm{I}^{-}\right)$of concentration $\mathrm{C}_{1}=0.80 \mathrm{~mol} . \mathrm{L}^{-1}$ with a volume 100 mL of sodium peroxydisulfate solution $\left(2 \mathrm{Na}^{+}+\mathrm{S}_{2} \mathrm{O}_{8}^{2-}\right)$ of concentration $\mathrm{C}_{2}=0.20 \mathrm{~mol} . \mathrm{L}^{-1}$.

A brown color is observed which intensifies with time representing a complete reaction that takes place according to the following equation:

$$
\mathrm{S}_{2} \mathrm{O}_{8}^{2-}+2 \mathrm{I}^{-} \quad \rightarrow \quad 2 \mathrm{SO}_{4}^{2-}+\mathrm{I}_{2}
$$

At different time intervals, a precise volume of the solution ( S ) is taken and the iodine formed is titrated, in the presence of starch solution, using a sodium thiosulfate solution ( $2 \mathrm{Na}^{+}+\mathrm{S}_{2} \mathrm{O}_{3}^{2-}$ ) according to the equation:

$$
\mathrm{I}_{2}+2 \mathrm{~S}_{2} \mathrm{O}_{3}^{2-} \rightarrow 2 \mathrm{I}^{-}+\mathrm{S}_{4} \mathrm{O}_{6}^{2-}
$$

## Given:

$$
\begin{aligned}
& \text { - } \mathrm{Fe}^{2+} \text { is a catalyst for the reaction of formation of iodine. } \\
& -\mathrm{M}\left(\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3} .5 \mathrm{H}_{2} \mathrm{O}\right)=248 \mathrm{~g} \cdot \mathrm{~mol}^{-1} \\
& \hline
\end{aligned}
$$

## 1- Preparation of Sodium Thiosulfate Solution

The sodium thiosulfate solution, used to titrate iodine, is prepared by dissolving a mass $\mathrm{m}=25.0 \mathrm{~g}$ of the hydrated powder $\left(\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3} .5 \mathrm{H}_{2} \mathrm{O}\right)$ in distilled water in order to have a solution of volume $V=500.0 \mathrm{~mL}$.
1.1- List the essential materials needed to carry out this preparation.
1.2- Calculate the molar concentration C of this solution.

## 2- Titration of Iodine

2.1- Propose, by justifying, an experimental way to stop the formation of iodine in each volume taken before carrying out titration.
2.2-Specify the color change at equivalence.

## 3- Kinetic Study

3.1- Given the shapes of the two curves $a$ and $b$.

Choose the one that corresponds to the change of the iodine concentration, in the solution S , versus time: $\left[\mathrm{I}_{2}\right]=\mathrm{f}(\mathrm{t})$.Justify

3.2- The experimental study shows that this reaction ends at $\mathrm{t}=70 \mathrm{~min}$.
3.2.1-Define the half- life time of the reaction
3.2.2- Choose, by justifying, among the three following proposals, the appropriate one for the half-life time :

$$
\mathrm{t}_{1 / 2}=35 \mathrm{~min} ; \quad \mathrm{t}_{1 / 2}>35 \mathrm{~min} ; \quad \mathrm{t}_{1 / 2}<35 \mathrm{~min} .
$$

3.3- The interval of time $\Delta t$ denotes the end time of reaction for each of the reacting mixtures considered in the table below:

| Reacting mixture | Temperature of the <br> mixture | $\Delta \mathrm{t}$ |
| :---: | :---: | :---: |
| Mixture (1) :a volume V of solution (S) | $40^{\circ} \mathrm{C}$ | $\Delta \mathrm{t}_{1}$ |
| Mixture (2) $: \mathrm{a}$ volume V of solution (S) <br> + few mL of a solution of $\mathrm{Fe}^{2+}$ ions <br> (without a noticeable change in <br> volume). | $20^{\circ} \mathrm{C}$ | $\Delta \mathrm{t}_{2}$ |

Verify whether $\Delta t_{1}$ and $\Delta t_{2}$ could be compared.

First exercise ( 7 points)

| Part of the $\mathbf{Q}$ | Answer | Mark |
| :---: | :---: | :---: |
| 1.1 | The concentration is: $\begin{aligned} & \mathrm{C}_{0}=\frac{\mathrm{n}_{\text {solute }}}{\mathrm{V}_{\text {solution }} \text { in } \mathrm{L}}=\frac{\mathrm{m}_{\text {solute }}}{\mathrm{M} \times \mathrm{V} \times 10^{-3}}=\frac{\mathrm{m}_{\text {solution }} \times \text { percentage }}{100 \times \mathrm{M} \times \mathrm{V} \times 10^{-3}}= \\ & \frac{\mathrm{d} \times \mathrm{V} \times \text { percentage }}{\mathrm{M} \times \mathrm{V} \times 10^{-1}}=\frac{1.47 \times 46 \times 10}{81}=8.35 \mathrm{~mol} . \mathrm{L}^{-1} . \end{aligned}$ | 1 |
| 1.2 | During dilution, the number of moles of the solute is conserved. $\mathrm{F}=\frac{\mathrm{C}_{0}}{\mathrm{C}}=\frac{\mathrm{V}}{\mathrm{~V}_{0}}=200 ; \text { so } \mathrm{V}_{0}=\frac{1000}{200}=5 \mathrm{~mL} .$ <br> Take using a volumetric pipet of 5 mL and a pipet-filler, 5 mL of the commercial solution, pour them into 1 L volumetric flask containing a certain quantity of distilled water. Complete the volume with distilled water to reach the line mark. Shake well to homogenize the solution. | 1 |
| 1.3.1 | The concentration of the solution $(\mathrm{S})$ is $\mathrm{C}_{\mathrm{S}}=\frac{8.35}{200}=0.041 \mathrm{~mol} \cdot \mathrm{~L}^{-1}$. $-\log \mathrm{C}_{\mathrm{S}}=-\log 0.041=1.38=\mathrm{pH}$ <br> Therefore HBr is a strong acid. | 0.75 |
| 1.3.2 | The equation of the reaction of HBr with water is: $\mathrm{HBr}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{Br}^{-}$ | 0.5 |
| 2.1 | The equation of the titration reaction is : $\mathrm{NH}_{3}+\mathrm{H}_{3} \mathrm{O}^{+} \rightarrow \mathrm{NH}_{4}^{+}+\mathrm{H}_{2} \mathrm{O}$ | 0.5 |
| 2.2 | At the equivalence point, the chemical species present in the medium, other than water, are $\mathrm{NH}_{4}^{+}$and $\mathrm{Br}^{-} . \mathrm{Br}^{-}$is spectator ion, while $\mathrm{NH}_{4}^{+}$is an acid that reacts with water to make the medium acidic. | 0.5 |
| 2.3 | At the equivalence point, the number of moles of $\mathrm{NH}_{3}$ in 10 mL of the ammonia solution is equal to the number of moles of $\mathrm{H}_{3} \mathrm{O}^{+}$in $\mathrm{Va}_{\mathrm{E}}$ : $\begin{aligned} & \mathrm{Cb} \times \mathrm{Vb}=\mathrm{Ca} \times \mathrm{Va}_{\mathrm{E}} . \\ & \mathrm{Cb}=\frac{0.041 \times 12}{10}=5.0 \times 10^{-2} \mathrm{~mol} . \mathrm{L}^{-1} . \end{aligned}$ | 0.75 |
| 2.4 | The volume of ammonia needed to prepare 1 L of the ammonia solution is $\mathrm{V}=\mathrm{n} \times \mathrm{V}_{\mathrm{m}}=0.05 \times 24=1.20 \mathrm{~L}$. | 0.5 |
| 3 | In order to prepare this buffer solution, $\mathrm{H}_{3} \mathrm{O}^{+}$must be the limiting reactant. <br> According to the equation of the reaction ( part 2.1): | 1.5 |

|  | Applying the relation : $\mathrm{pH}=\mathrm{pKa}+\log \frac{\left[\mathrm{NH}_{3}\right]}{\left[\mathrm{NH}_{4}^{+}\right]}=\ldots \ldots$, therefore |
| :--- | :--- | :--- |
| $9=9.2+\log \frac{0.05 \times 50-0.041 \mathrm{~V}_{1}}{0.041 \mathrm{~V}_{1}}$ |  |
| $\log \frac{0.05 \times 50-0.041 \mathrm{~V}_{1}}{0.041 \mathrm{~V}_{1}}=-0.2$ |  |
| $\frac{0.05 \times 50-0.041 \mathrm{~V}_{1}}{0.041 \mathrm{~V}_{1}}=0.63$ So $\mathrm{V}_{1}=36.7 \mathrm{~mL}$ |  |

Second exercise ( 6 points)

| Part of the Q | Answer | mark |
| :---: | :---: | :---: |
| 1.1 | (A) plays the role of an acid since its reaction with a metal releases hydrogen gas. | 0.5 |
| 2.2 | From the experiment 2, (A) can be either an alcohol or a carboxylic acid. Therefore the compound B can be a chloroalkane or an acyl chloride. | 0.5 |
| 2.3 | Since (B) contains only carbon, hydrogen and chlorine, therefore B is a chloroalkane and by consequence the compound (A) is a saturated noncyclic chain alcohol of general formula $\mathrm{C}_{\mathrm{x}} \mathrm{H}_{2 \mathrm{x}+2} \mathrm{O}$. | 0.5 |
| 2.1 | According to the law of the conservation of mass : <br> $\mathrm{n}($ atom of C$)$ in the alcohol $=\mathrm{n}($ atom of C$)$ in the ester $-\mathrm{n}($ atom of C$)$ in the acid $=3$. <br> Therefore the molecular formula of $(A)$ is $\mathrm{C}_{3} \mathrm{H}_{8} \mathrm{O}$. | 0.75 |
| 2.2 | The possible condensed structural formulas of the ester (E) are: $\mathrm{CH}_{3}-\mathrm{COO}-\mathrm{CH}_{2}-\mathrm{CH}_{2}-\mathrm{CH}_{3}$ and $\mathrm{CH}_{3}-\mathrm{COO}-\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}$. | 0.5 |
| 2.3 | $\mathrm{n}(\mathrm{~A}) \text { initial }=\frac{\mathrm{m}(\mathrm{~A}) \text { initial }}{\mathrm{M}(\mathrm{~A})}=\frac{\mathrm{d}(\mathrm{~A}) \times \mathrm{V}}{\mathrm{M}(\mathrm{~A})}=0.5 ; \text { so } \mathrm{V}=\frac{60 \times 0.5}{0.78}=38.5 \mathrm{~mL} .$ | 0.75 |
| 2.4 |  $\left.\mathrm{K}=\frac{[R \mathrm{ROOH}] \times\left[\mathrm{R}^{\prime} \mathrm{OH}\right]}{[R \mathrm{ROOR}}{ }^{\prime}\right] \times\left[\mathrm{H}_{2} \mathrm{O}\right]=\ldots .=\frac{0.3 \times 0.3}{0.2 \times 0.2}=2.25$ | 1 |
| 2.5 | Since the equilibrium constant K is equal to 2.25 , therefore (A) is a secondary alcohol of formula <br> $\mathrm{CH}_{3}-\mathrm{CHOH}-\mathrm{CH}_{3} ; 2$-propanol. <br> The name of the ester is 1-methylethyl ethanoate. | 0.75 |
| 2.6 | When ethanoic acid is replaced by ethanoic anhydride, the esterification reaction becomes complete and n (ester) obtained will be equal to 0.5 mol . $\mathrm{m}($ ester $)$ obtained $=\mathrm{n}($ ester $) \times \mathrm{M}($ ester $)=0.5 \times 88=44 \mathrm{~g}$. | 0.75 |

Third exercise (7 points)

| Part of the $\mathbf{Q}$ | Answer | Mark |
| :---: | :---: | :---: |
| 1.1 | The essential materials are: precision balance, spatula, funnel, watch glass and 500 mL volumetric flask. | 1.25 |
| 1.2 | Concentration of this solution: $\mathrm{C}=\frac{n(\text { solute }) \text { int roduced }}{V(\text { solution })}=\frac{m(\text { solute }) \text { int roduced }}{M(\text { solute }) \times V(\text { solution })}=\frac{25}{248 \times 0.5}=0.20$ | 0.75 |
| 2.1 | To stop the reaction of formation of iodine, the volume taken is poured into icy water. <br> This choice decreases the temperature as well as the concentration of the reactants that makes the rate of the reaction almost null and the reaction will be stopped. | 0.75 |
| 2.2.1 | At equivalence the color of the medium turns from blue to colorless with one drop in excess. | 0.5 |
| 2.2.2 | - Limiting reactant: $\begin{aligned} & \mathrm{R}_{\mathrm{I}^{-}}=\frac{n\left(I^{-}\right) \text {initial }}{2}=\frac{\mathrm{C}_{1} \times \mathrm{V}_{1}}{2}=\frac{0.80 \times 0.1}{2}=0.04 \\ & \mathrm{R}_{\mathrm{S}_{2} \mathrm{O}_{8}^{2-}}=\frac{n\left(S_{2} O_{8}^{2-}\right) \text { initial }}{1}=\mathrm{C}_{2} \times \mathrm{V}_{2}=0.20 \times 0.1=0.02 \end{aligned}$ <br> $\mathrm{R}_{\mathrm{S}_{2} \mathrm{O}_{8}^{2-}}<\mathrm{R}_{\mathrm{I}^{-}} ; \mathrm{S}_{2} \mathrm{O}_{8}^{2-}$ is the limiting reactant. <br> $n\left(\mathrm{I}_{2}\right)$ formed at the end of the reaction $=\mathrm{n}\left(\mathrm{S}_{2} \mathrm{O}_{8}^{2-}\right)$ initial $=0.02 \mathrm{~mol}$. and $\left[\mathrm{I}_{2}\right]$ at the end $=\frac{0.02}{0.2}=0.1 \mathrm{~mol} . \mathrm{L}^{-1}$ <br> The curve (a) exceeds the value of 0.1 , therefore the curve (b) corresponds to the variation $\left[\mathrm{I}_{2}\right]=\mathrm{f}(\mathrm{t})$. | 1.5 |
| 3.1 | The half-life time of the reaction is the time needed for the quantity of the limiting reactant to lose half of its initial value. | 0.5 |
| 3.2.2 | $\mathrm{t}_{1 / 2}<35 \mathrm{~min}$, because the reaction rate decreases with time and consequently the transformation of the $1^{\text {st }}$ half of the quantity of the limiting reactant takes a smaller time than that of the $2{ }^{\text {nd }}$ half. | 0.75 |
| 3.3 | Passing from mixture 1 to mixture 2 : <br> - The concentrations of the reactants are the same. <br> - The temperature decreases and the rate of the reaction decreases. <br> - $\mathrm{Fe}^{2+}$ ions catalyze the mixture 2 and the rate of the reaction increases. <br> Therefore, we cannot compare $\Delta t_{1}$ and $\Delta t_{2}$ because each kinetic factor changes the rate in an opposed direction. | 1 |

## Second Exercise (6 points) (L.S)

| Part of the Q | Answer | Mark |
| :---: | :---: | :---: |
| 1.1 | (A) plays the role of an acid since its reaction with a metal releases hydrogen gas. | 0.5 |
| 1.2 | From the experiment 2, (A) can be either an alcohol or a carboxylic acid. Therefore the compound B can be a chloroalkane or an acyl chloride. | 0.5 |
| 1.3 | Since (B) contains only carbon, hydrogen and chlorine, therefore B is a chloroalkane and by consequence the compound (A) is a saturated noncyclic chain alcohol of general formula $\mathrm{C}_{\mathrm{x}} \mathrm{H}_{2 \mathrm{x}+2} \mathrm{O}$. | 0.5 |
| 2.1 | According to the law of the conservation of mass : $\mathrm{n}($ atom of C$)$ in the alcohol $=\mathrm{n}($ atom of C$)$ in the ester $-\mathrm{n}($ atom of C$)$ in the acid $=4$. Therefore the molecular formula of $(A)$ is $\mathrm{C}_{4} \mathrm{H}_{10} \mathrm{O}$. | 0.75 |
| 2.2 | The possible condensed structural formulas of the ester ( E ) are: $\mathrm{CH}_{3}-\mathrm{COO}-\mathrm{CH}_{2}-\mathrm{CH}_{2}-\mathrm{CH}_{2}-\mathrm{CH}_{3} ; \mathrm{CH}_{3}-\mathrm{COO}-\mathrm{CH}_{2}-\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}$. $\mathrm{CH}_{3}-\mathrm{COO}-\mathrm{C}\left(\mathrm{CH}_{3}\right)_{3} ; \mathrm{CH}_{3}-\mathrm{COO}-\mathrm{CH}\left(\mathrm{CH}_{3}\right)-\mathrm{CH}_{2}-\mathrm{CH}_{3}$. | 1 |
| 2.3 |  $\left.\mathrm{K}=\frac{[\mathrm{RCOOH}] \times\left[\mathrm{R}^{\prime} \mathrm{OH}\right]}{[R \mathrm{ROOR}}{ }^{\prime}\right] \times\left[\mathrm{H}_{2} \mathrm{O}\right] \quad=\ldots=\frac{0.3 \times 0.3}{0.2 \times 0.2}=2.25$ | 1 |
| 2.4 | Since the equilibrium constant K is equal to 2.25 , therefore (A) is a secondary alcohol of formula $\mathrm{CH}_{3}-\mathrm{CH}(\mathrm{OH})-\mathrm{CH}_{2}-\mathrm{CH}_{3} .$ <br> This is 2-butanol. <br> The name of the ester is 1-methylpropyl ethanoate. | 1 |
| 2.5 | The two enantiomers are: | 0.75 |
