مسابقة في مـادة الفيزياء: ساعتان

## This exam is formed of three exercises in three pages numbered from 1 to 3.

The use of a non-programmable calculator is recommended.

## First exercise : ( 6 ½ pts) Horizontal mechanical oscillator

Consider a mechanical oscillator that is formed of a solid (S) of mass $m=0.1 \mathrm{~kg}$ and a spring whose stiffness (force constant) is $k$. (S) may move, without friction, on a horizontal track with its center of mass $G$ on a horizontal axis $x^{\prime} x$.
An apparatus is used to register the positions of the center of mass $G$ at successive instants separated by a constant time interval $\tau=20 \mathrm{~ms}$.
(S) is shifted , in the positive direction , from the equilibrium position O of G by a certain distance, and then is released without initial velocity at the instant $\mathrm{t}_{0}=0$.
The above apparatus gives the positions $G_{0}, G_{1}, G_{2}, G_{3} \ldots$ of $G$ at the instants $t_{0}=0, t_{1}=\tau, t_{2}=$ $2 \tau$, $\mathrm{t}_{3}=3 \tau$ $\qquad$ respectively.

Some of the positions of G are given in the following table:

| t | 0 | $\tau$ | $2 \tau$ | $3 \tau$ | $4 \tau$ | $5 \tau$ | $6 \tau$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{OG}=\mathrm{x}(\mathrm{cm})$ | $\mathrm{OG}_{0}$ | $\mathrm{OG}_{1}=9.53$ | $\mathrm{OG}_{2}=8.09$ | $\mathrm{OG}_{3}=5.88$ | $\mathrm{OG}_{4}=$ <br> 3.09 | $\mathrm{OG}_{5}=0$ | $\mathrm{OG}_{6}=-3.09$ |

1) At the instant $t$, the abscissa of $G$ is $x$ and the algebraic value of its velocity is $v$.

Write the expression of the mechanical energy of the system (oscillator, Earth) in terms of $\mathrm{x}, \mathrm{v}, \mathrm{m}$ and k . Take the horizontal plane through G as a gravitational potential energy reference.
2) Derive the second order differential equation that governs the motion of G.
3) The solution of this differential equation may be written in the form:
$\mathrm{x}=\mathrm{X}_{\mathrm{m}} \sin \left(\omega_{0} \mathrm{t}+\varphi\right)$ where $\mathrm{X}_{\mathrm{m}}, \omega_{0}$ and $\varphi$ are constants.
a) Determine the expression of $\omega_{0}$ in terms of $m$ and $k$.
b) Determine the position of $G$ for which the speed of $(\mathrm{S})$ is maximum $\left(\mathrm{V}_{\max }\right)$.
c) Applying the principle of conservation of mechanical energy, show that:

$$
\left(V_{\max }\right)^{2}=v^{2}+\omega_{0}^{2} x^{2} .
$$

4) Using the above table, show that:
a) the speed at the instant $\mathrm{t}_{3}$ is $1.250 \mathrm{~m} / \mathrm{s}$;
b) the maximum speed is $\mathrm{V}_{\text {max }}=1.545 \mathrm{~m} / \mathrm{s}$.
5) Deduce the value of $k$.

## Second exercise: ( 7 pts) The capacitor - A humidity sensor

In order to show evidence of the role of the capacitor in the humidity sensor, we connect up the circuit of figure 1 .
This circuit is formed of a function generator (LFG) delivering across its terminals an alternating sinusoidal voltage of frequency f , a coil of inductance $\mathrm{L}=0.07 \mathrm{H}$ and of negligible resistance, a resistor of resistance $\mathrm{R}=100 \mathrm{~K} \Omega$ and a capacitor of capacitance C.
The voltage across the LFG is $\mathrm{u}_{\mathrm{AM}}=\mathrm{U}_{\mathrm{m}} \sin \omega \mathrm{t},(\omega=2 \pi \mathrm{f})$. The circuit thus carries an instantaneous current given by: $\mathrm{i}=\mathrm{I}_{\mathrm{m}} \sin (\omega \mathrm{t}+\varphi)$

1) We denote by $u_{C}=u_{B N}$ the instantaneous voltage across the capacitor, by $\mathrm{u}_{\mathrm{AB}}$ the voltage across the coil and by $\mathrm{u}_{\mathrm{NM}}$ that across the resistor.

Figure 1

Show that:
a) $i=C \frac{\mathrm{du}_{\mathrm{C}}}{\mathrm{dt}}$
b) $u_{C}$ may be written in the form: $u_{C}=\frac{-I_{m}}{C \omega} \cos (\omega t+\varphi)$.
c) $\mathrm{u}_{\mathrm{AB}}=\mathrm{L} \omega \mathrm{I}_{\mathrm{m}} \cos (\omega \mathrm{t}+\varphi)$.
2) The relation: $u_{A M}=u_{A B}+u_{B N}+u_{N M}$ is valid for any $t$. Show, giving $\omega t$ a particular value, that:

$$
\tan \varphi=\frac{\frac{1}{\mathrm{C} \omega}-\mathrm{L} \omega}{\mathrm{R}}
$$

3) An oscilloscope, conveniently connected, displays the variations, as a function of time , of $\mathrm{u}_{\mathrm{AM}}$ and $\mathrm{u}_{\mathrm{NM}}$ on the channels ( $\mathrm{Y}_{1}$ ) and $\left(\mathrm{Y}_{2}\right)$ respectively .These variations are

Figure 2 represented in the waveforms of figure 2.
a) Redraw figure 1 showing the connections of the oscilloscope.
b) The waveform of $u_{N M}$ represents the «image» of the current i. Why?
c) Find the value of f , knowing that the horizontal sensitivity is $5 \mathrm{~ms} /$ division.
d) Determine the phase difference $\varphi$ between i and $\mathrm{u}_{\mathrm{Am}}$.
4) Deduce the value of the capacitance $C$.
5) The frequency $f$ is made to vary, keeping the same effective value of $u_{A M}$. It is noticed that, for a value $f_{1}$ of $f, u_{\text {AM }}$ is in phase with $i$.
a) Give the name of the phenomenon that appears in the circuit.
b) Deduce, from what preceded, the relation among $\mathrm{L}, \mathrm{C}$ and $\mathrm{f}_{1}$.
6) A commercial humidity sensor can be considered as a capacitor whose capacitance C increases when the rate of relative humidity H \% of air increases.
The manufacturer provides the graph of the variation of C as a function of the rate of the
 relative humidity $\mathrm{H} \%$ (Fig.3). ( $1 \mathrm{pF}=10^{-12} \mathrm{~F}$ ).
We replace the capacitor of the circuit of figure 1 by the sensor.
In order to measure the value of $C$, the frequency $f$ is made to vary; we notice that the voltage $\mathrm{u}_{\mathrm{Am}}$ and the current i are in phase for a frequency $\mathrm{f}=5.20 \times 10^{4} \mathrm{~Hz}$.

Deduce the rate of relative humidity of air under the atmospheric conditions of the experiment.

## Third exercise: ( $6^{1 / 2}$ pts) Emission spectrum of a mercury vapor lamp

The object of this exercise is to determine the visible emission spectrum of a mercury vapor lamp. The adjacent diagram gives, in a simplified way, the energy level of the ground state, those of the excited states $\mathrm{E}_{2}, \mathrm{E}_{3}, \mathrm{E}_{4}, \mathrm{E}_{5}, \mathrm{E}_{6}, \mathrm{E}_{7}, \mathrm{E}_{8}$ and the ionization energy level $\mathrm{E}=0$ of the mercury atom.

## Given:

Planck's constant $\mathrm{h}=6.62 \times 10^{-34} \mathrm{~J}$. s; speed of light in vacuum : c $=3 \times 10^{8} \mathrm{~m} / \mathrm{s}$; $1 \mathrm{eV}=1.6 \times 10^{-19} \mathrm{~J}$;
$I$ - Quantization of the energy of the atom

1) The energy of the mercury atom is quantized. What is meant by "quantized energy"?
2) a) What is meant by «ionizing» an atom ?
b) Calculate, in eV , the ionization energy of a mercury atom taken in the ground state.

## 3) Interaction photon-atom.

A photon cannot cause the transition of an atom from an energy level $\mathrm{E}_{\mathrm{p}}$ to a higher energy level $\mathrm{E}_{\mathrm{n}}$ unless its energy is exactly the same as the difference of the energies ( $E_{n}-E_{P}$ ) of the atom.
The mercury atom being in the ground state.
a) Determine the maximum wavelength of the wave associated to a photon capable
 of exciting this atom.
b) The mercury atom is hit with a photon of wavelength $\lambda_{1}=2.062 \times 10^{-7} \mathrm{~m}$.
i) Show that this photon cannot be absorbed.
ii) What is then the state of this atom?
c) The atom receives now a photon of wavelength $\lambda_{2}$. The atom is thus ionized and the extracted electron is at rest. Calculate $\lambda_{2}$.

## II- Emission by a mercury vapor lamp

For an electron to cause a transition of an atom from an energy level $E_{p}$ to a higher energy level $E_{n}$, its energy must be at least equal to the difference of the energies ( $E_{n}-E_{p}$ ) of the atom.
During one electron-atom collision, the atom absorbs, from the electron , an amount of energy enough to ensure a transition. The rest of the energy is carried by the electron as kinetic energy. When the mercury vapor lamp is under a convenient voltage, an electric discharge takes place. Some electrons, each of kinetic energy 9 eV , moving in the vapor of mercury between the electrodes of the lamp, hit the gaseous atoms giving them energy. For that lamp, the atoms are initially in the ground state.

1) Verify that an atom may not overpass the energy level $E_{7}$.
2) The visible emission spectrum due to the downward transition of the mercury atom, is formed of four rays of wavelengths: $\lambda_{7 \rightarrow 4} ; \lambda_{6 \rightarrow 2} ; \lambda_{5 \rightarrow 2} ; \lambda_{5 \rightarrow 3}$ (refer to the diagram).
Determine the wavelengths of the limits of the visible spectrum of the mercury vapor lamp.

First exercise ( $61 / 2$ pts)

1) $\mathrm{ME}=\mathrm{KE}+\mathrm{PE}_{\mathrm{g}}+\mathrm{PE}_{\mathrm{el}}=1 / 2 \mathrm{mv}^{2}+1 / 2 \mathrm{kx}^{2}+0(\mathbf{1} / \mathbf{2}$ pt)
2) Friction is neglected
$\Rightarrow \frac{d E_{m}}{d t}=0=\mathrm{mxx}^{\prime \prime}+\mathrm{kxx} \mathrm{x}^{\prime}=>\mathrm{x}^{\prime \prime}+\frac{k}{m} \mathrm{x}=0 .(\mathbf{1} / \mathbf{2} \mathbf{~ p t})$
3) $\mathbf{a -} \mathrm{x}^{\prime}=\mathrm{X}_{\mathrm{m}} \omega_{0} \cos (\omega \mathrm{t}+\varphi) \Rightarrow$
$x^{\prime \prime}=-X_{m} \omega_{0}{ }^{2} \sin (\omega t+\varphi)$; replace $x^{\prime \prime}$ and $x$ in the obtained differential equation, we obtain :

$$
-\mathrm{X}_{\mathrm{m}} \omega_{0}^{2} \sin (\omega \mathrm{t}+\varphi)+\frac{k}{m} \mathrm{X}_{\mathrm{m}} \sin (\omega \mathrm{t}+\varphi)=0
$$

$\Rightarrow \mathrm{X}_{\mathrm{m}} \sin (\omega \mathrm{t}+\varphi)\left(-\omega_{0}^{2}+\frac{k}{m}\right)=0 \Rightarrow \omega_{0}=\sqrt{\frac{k}{m}}$

$$
(1 \mathrm{pt})
$$

$\mathbf{b}-\mathrm{v}=\mathrm{x}^{\prime}=\mathrm{X}_{\mathrm{m}} \omega_{0} \cos (\omega \mathrm{t}+\varphi) ;|\mathrm{v}|$ is max when $\cos (\omega \mathrm{t}+\varphi)= \pm 1 \Rightarrow \mathrm{x}=0$.
( or we apply the conservation of ME)
(1 pt)
$\mathrm{c}-\mathrm{ME}=\mathrm{cte}=\mathrm{ME}($ at point O$)=\mathrm{ME}_{\mathrm{t}}$ (any point of abscissa x and speed v). $\Rightarrow 1 / 2 \mathrm{~m}\left(\mathrm{~V}_{\max }\right)^{2}=1 / 2 \mathrm{mv}^{2}+1 / 2 \mathrm{kx}^{2}$ $=>\left(\mathrm{V}_{\max }\right)^{2}=\mathrm{v}^{2}+\omega_{0}{ }^{2} \mathrm{x}^{2} \quad$ (1pt)
4) $\mathbf{a -} \mathrm{v}_{3}=\frac{G_{4} G_{2}}{2 \tau}=1.250 \mathrm{~m} / \mathrm{s} . \quad(\mathbf{1} / 2 \mathrm{pt})$
b- $\mathrm{V}_{\text {max }}=\mathrm{v}_{\mathrm{O}}=\frac{G_{6} G_{4}}{2 \tau}=1.545 \mathrm{~m} / \mathrm{s} .(\mathbf{1} / \mathbf{2 p t})$
5) By using the relation $\left(\mathrm{V}_{\max }\right)^{2}=\mathrm{v}^{2}+\omega_{0}{ }^{2} \mathrm{x}^{2}$ at the point of abscissa $x_{3}=5.88 \mathrm{~cm}$, we obtain : $\omega_{0}=15.44 \mathrm{rad} / \mathrm{s}$.
(1pt)
But $\omega_{0}=\sqrt{\frac{k}{m}} \Rightarrow \mathrm{k}=23.85 \mathrm{~N} / \mathrm{m} . \quad(\mathbf{1} / \mathbf{2} \mathbf{~ p t})$

Second exercise: ( 7 pts)

1) $\mathbf{a -} \mathrm{i}=\mathrm{dq} / \mathrm{dt}$ and $\mathrm{q}=\mathrm{C} \mathrm{u}_{\mathrm{C}} \quad \Rightarrow \mathrm{i}=\mathrm{Cdu}_{\mathrm{C}} / \mathrm{dt}$. (1/2 pt)
b- $u_{C}=\frac{1}{C} \int i d t=\frac{-I_{m}}{C \omega} \cos (\omega t+\varphi) \cdot(\mathbf{1} / 2 \mathbf{p t})$

$$
\mathrm{c}-\mathrm{u}_{\mathrm{AB}}=\mathrm{Ldi} / \mathrm{dt}=\operatorname{L\omega I} \mathrm{I}_{\mathrm{m}} \cos (\omega \mathrm{t}+\varphi)(\mathbf{1} / \mathbf{2 p t})
$$

2) $u_{A M}=u_{A B}+u_{B N}+u_{N M}$
$\Rightarrow \mathrm{U}_{\mathrm{m}} \sin \omega \mathrm{t}=$
$L \omega I_{m} \cos (\omega t+\varphi)-\left(I_{m} / C \omega\right) \cos (\omega t+\varphi)+\mathrm{RI}_{\mathrm{m}} \sin (\omega \mathrm{t}+$ $\varphi$ ).

For $\omega \mathrm{t}=0 \Rightarrow 0=\mathrm{L} \omega \mathrm{I}_{\mathrm{m}} \cos \varphi-\left(\mathrm{I}_{\mathrm{m}} / \mathrm{C} \omega\right) \cos \varphi+\mathrm{RI}_{\mathrm{m}} \sin \varphi$

$$
\Rightarrow \tan \varphi=\frac{\frac{1}{\mathrm{C} \omega}-\mathrm{L} \omega}{\mathrm{R}}
$$

(1 pt)
3) a- Branching of the oscilloscope. ( $\mathbf{1 / 2} \mathbf{~ p t )}$

b- $u_{\mathrm{CM}}=\mathrm{Ri} \mathrm{i}=\mathrm{u}_{\mathrm{NM}} / \mathrm{cte} \Rightarrow$ the curve of $\mathrm{u}_{\mathrm{NM}}$ represents the «image » of i (1/2 pt)
$\mathbf{c -} \mathrm{T} \rightarrow 4 \mathrm{div} \Rightarrow \mathrm{T}=20 \mathrm{~ms} \Rightarrow \mathrm{f}=50 \mathrm{~Hz}(\mathbf{1} / \mathbf{2} \mathbf{~ p t})$
$\mathbf{d}-|\varphi|=\frac{\pi}{4} \operatorname{rad}(\mathbf{1 / 2} \mathbf{~ p t})$
4) $\omega=\frac{2 \pi}{T}=100 \pi$, the relation $\tan \varphi=\frac{\frac{1}{\mathrm{C} \omega}-\mathrm{L} \omega}{\mathrm{R}}$

$$
\Rightarrow \mathrm{C}=32 \mathrm{nF} \text { (1/2pt) }
$$

5) a- Current resonance ( $1 / 2 \mathrm{pt}$ )
b- At current resonance : $\varphi=0 \Rightarrow \frac{1}{\mathrm{C} \omega}-\mathrm{L} \omega=0 \Rightarrow 4$ $\pi^{2}$ LCf $_{1}{ }^{2}=1 \quad$ (1/2pt)
6) $\mathrm{C}=132 \mathrm{pF}$. Graphically for $\mathrm{C}=132 \mathrm{pF}$, the relative humidity of air is $70 \%$. ( $\mathbf{1} \mathbf{~ p t )}$

Third exercise: ( $6^{1 / 2}$ pts)
I-

1) only specific values of energy are allowed ( $\mathbf{1} / \mathbf{2} \mathbf{~ p t}$ )
2) a- giving the atom an energy to extract an electron ( $\mathbf{1} / \mathbf{2} \mathbf{~ p t}$ ) b- E (ionization $)=\mathrm{E}-\mathrm{E}_{1}=0-(-10.45)=10.45 \mathrm{eV} . \quad(\mathbf{1} / \mathbf{2} \mathbf{~ p t})$
3) $\mathrm{a}-\lambda=\frac{h c}{E_{n}-E_{1}}$.
$\lambda_{\text {max }}$ correspond $\left(\mathrm{E}_{\mathrm{n}}\right)_{\text {min }} \Leftrightarrow \mathrm{n}=2 \Rightarrow \lambda_{\text {max }}=2.54 \times 10^{-7} \mathrm{~m}(\mathbf{1} \mathbf{~ p t})$ b- i) For $\lambda_{1}$, the energy of the photon is:
$\mathrm{E}=\frac{h c}{\lambda}=9.63 \times 10^{-19} \mathrm{~J}=6.02 \mathrm{eV}$; the energy level of the atom must be $E_{1}+E=-4,43 \mathrm{eV}$; but this level does not exist in the energy diagram, so the photon is not absorbed ( $\mathbf{1} \mathbf{~ p t}$ )
ii) The atom remains in the ground state ( $\mathbf{1 / 4} \mathbf{~ p t )}$
c- $\mathrm{W}=10.45 \mathrm{eV} \Rightarrow \lambda_{2}=1.188 \times 10^{-7} \mathrm{~m}$.
(3/4 pt)
II-1- $\mathrm{E}_{1}+9=(-10.45)+9=-1.45 \mathrm{eV}<\mathrm{E}_{8} \quad(\mathbf{1} \mathbf{~ p t})$
2- $(\Delta \mathrm{E})_{6 \rightarrow 2}=3.04 \mathrm{eV} ;(\Delta \mathrm{E})_{5 \rightarrow 3}=2,27 \mathrm{eV} ;(\Delta \mathrm{E})_{7 \rightarrow 4}=2.14 \mathrm{eV}$

$$
\begin{aligned}
& (\Delta \mathrm{E})_{5 \rightarrow 2}=2.84 \mathrm{eV} .(\Delta \mathrm{E})_{\max }=3.04 \mathrm{eV} \text { et }(\Delta \mathrm{E})_{\min }=2.14 \mathrm{eV} \\
& \lambda=\frac{\mathrm{hc}}{\Delta \mathrm{E}} \\
& \lambda_{\min } \Rightarrow(\Delta \mathrm{E})_{\max }=\mathrm{E}_{6}-\mathrm{E}_{2} \Rightarrow \lambda_{6 \rightarrow 2}=408.3 \mathrm{~nm} \\
& \lambda_{\max } \Rightarrow(\Delta \mathrm{E})_{\min }=\mathrm{E}_{7}-\mathrm{E}_{4} \Rightarrow \lambda_{7 \rightarrow 4}=580.0 \mathrm{~nm} \quad \text { (1pt) }
\end{aligned}
$$
