## This exam is formed of three obligatory exercises in 3 pages. The use of non-programmable calculator is recommended

## Exercise 1 (6.5 points)

## Determination of the capacitance of a capacitor

The aim of this exercise is to determine the capacitance C of a capacitor. For this aim, consider the electric circuit shown in document 1 . The circuit includes a resistor of resistance $R$, a coil of inductance $L$ and of negligible resistance $r$, a capacitor of capacitance $C$, and a low frequency generator (LFG) delivering alternating sinusoidal voltage:

$$
u_{\mathrm{g}}=\mathrm{u}_{\mathrm{AD}}=\mathrm{U}_{\mathrm{m}} \cos (\omega \mathrm{t}) \quad(\mathrm{u} \text { in } \mathrm{V} ; \mathrm{t} \text { in } \mathrm{s}) .
$$

An oscilloscope is connected so as to visualize, as a function of time, the variation of the voltage $u_{A D}$ across the generator on channel $Y_{1}$ and the voltage $u_{B D}=u_{\text {coil }}$ across the coil on channel Y2 (Document 2).
The vertical sensitivity of channel 1 is: $\mathrm{Sv}_{1}=5 \mathrm{~V} /$ div.
The vertical sensitivity of channel 2 is: $\mathrm{Sv}_{2}=2 \mathrm{~V} /$ div.

1) Redraw the circuit of document 1 showing on it the connections of the oscilloscope.
2) Using the waveforms of document 2, determine:

2-1) the amplitudes $U_{m}$ and $U_{m(c o i l)}$ of the voltages $u_{g}$ and $u_{\text {coil }}$.
2-2) the phase difference between the two voltages.
3) Write the expression of the voltage $u_{\text {coil }}$ across the coil as function of time $t$ and the angular frequency $\omega$.
4) The expression of the current $i$ in the circuit is: $\mathrm{i}=\frac{9.375 \pi}{\omega} \cos (\omega \mathrm{t}) \quad(\mathrm{i}$ in $\mathrm{A} ; \mathrm{t}$ in s$)$.
Determine the expression of the voltage $u_{\text {coil }}$ across the terminals of the coil in terms of $\mathrm{L}, \omega$ and t .
5) Using the results of part 3 and 4 , show that $L=0.204 \mathrm{H}$.
6) Indicate the value of the phase difference between $u_{g}$ and $i$.
7) A phenomenon takes place in the circuit. Name this phenomenon.
8) Deduce the value of $C$ knowing that the angular frequency
 $\omega=300 \pi \mathrm{rad} / \mathrm{s}$.

## Exercise 2 (6.5 points)

## Ionization and fission of uranium

The aim of this exercise is to study the ionization and the fission of a uranium isotope.
Given:
$1 \mathrm{eV}=1.6 \times 10^{-19} \mathrm{~J}$; speed of light in vacuum: $\mathrm{c}=3 \times 10^{8} \mathrm{~m} / \mathrm{s}$; Planck's constant: $\mathrm{h}=6.6 \times 10^{-34} \mathrm{~J} . \mathrm{s}$. Mass of ${ }_{92}^{235} \mathrm{U}$ nucleus $=234.99342 \mathrm{u} ; 1 \mathrm{u}=1.66 \times 10^{-27} \mathrm{~kg}$.

## 1- Ionizing one of the uranium isotopes

A monochromatic radiation of frequency
$v=8 \times 10^{14} \mathrm{~Hz}$ illuminates a sample of uranium containing the isotopes ${ }_{92}^{235} \mathrm{U}$ and ${ }_{92}^{238} \mathrm{U}$.
1-1) Calculate, in Joules and in eV, the energy of a photon of the incident radiation.
1-2) Document 1 shows some of the energy levels of the isotopes ${ }_{92}^{235} \mathrm{U}$ and ${ }_{92}^{238} \mathrm{U}$. The photons of the incident radiation can excite one of these isotopes of uranium
 from energy level $E_{1}$ to energy level $E_{2}$.
Specify which of the two isotopes will be excited.
1-3) Before it de-excites, the excited isotope receives another photon of same frequency $v$.
1-3-1) Show that this isotope will be ionized.
1-3-2) Determine the maximum kinetic energy $\mathrm{KE}_{\max }$ of the liberated electron.
1-4) This experiment shows evidence of one of the two aspects of light. Name this aspect.

## 2- Nuclear reaction

The isotope of uranium which undergoes fission in the nuclear power plant is uranium-235.
One of the fission reactions of uranium- 235 nucleus is given by:

$$
{ }_{92}^{235} \mathrm{U}+{ }_{0}^{1} \mathrm{n} \rightarrow{ }_{36}^{90} \mathrm{Kr}+{ }_{56}^{\mathrm{X}} \mathrm{Ba}+8{ }_{0}^{1} \mathrm{n}+\gamma
$$

2-1) This reaction is provoked. Why?
2-2) What condition must the projectile satisfy in order to realize this reaction?
2-3) Use one of the conservation laws to calculate $x$.
2-4) The energy liberated by the fission of each nucleus of uranium- 235 is about 200 MeV . In what forms does this energy appear?
2-5) A nuclear power plant of efficiency $40 \%$ furnishes an electric power 600 MW .
Determine, in kg, the mass of uranium- 235 consumed in 1 day in this power plant.

## Exercise 3 (7 points)

## Determination of the mass of a block and the stiffness of a spring

Consider two blocks, (A) of unknown mass $m_{A}$ and (B) of mass $m_{B}=0.8 \mathrm{~kg}$, and a spring ( R ) of negligible mass and of stiffness $k$. The aim of this exercise is to determine $m_{A}$ and $k$. Neglect all the forces of friction and take $g=10 \mathrm{~m} / \mathrm{s}^{2}$.
1- First experiment: Determination of $m_{A}$
The spring is placed on a horizontal track. The spring is compressed between (A) and (B) by means of a light string (Document 1).

The center of mass of (A) and that of $(B)$ belong to the same horizontal plane which is taken as a reference level for gravitational potential energy.
The x -axis extends positively to the right.
We burn the string, (A) and (B) are ejected in opposite directions.

1-1) Name the external forces acting on the system [(A), (B) and (R)].
1-2) Deduce that the linear momentum of the system $[(A),(B)$ and $(R)]$ is conserved during the motion of $(\mathrm{A})$ and $(\mathrm{B})$ on the horizontal track.
1-3) The velocity of the center of mass of block (B) just after ejection is $\vec{V}_{B}=0.75 \vec{\imath}(\mathrm{~m} / \mathrm{s})$.
1-3-1) Determine the linear momentum $\overrightarrow{\mathrm{P}}_{\mathrm{A}}$ of block (A).
1-3-2) Deduce in terms of $m_{A}$ the velocity $\vec{V}_{A}$ of the center of mass of (A) just after ejection.
1-4) Block (A) continues its motion and reaches a curvilinear path CD situated in the vertical plane (Document 1). The maximum height attained by the center of mass of (A) above the reference level is $h_{\text {max }}=5 \mathrm{~cm}$.
1-4-1) Apply the principle of conservation of mechanical energy to the system [(A), Earth] to determine the magnitude $V_{A}$ of $\vec{V}_{A}$.
1-4-2) Deduce the value of the mass $\mathrm{m}_{\mathrm{A}}$.

## 2- Second experiment: Determination of $k$

We fix block (B) to one of the ends of the spring (R), the other end of the spring is attached to a fixed support (Document 2).
At equilibrium, ( B ) is at O taken as an origin of abscissa of the axis
 x'x.
(B) is displaced, from point O along the axis $\mathrm{x}^{\prime} \mathrm{x}$ by a distance $\mathrm{X}_{\mathrm{m}}$ in the negative direction, and then it is released without initial velocity at the instant $t_{0}=0$. At an instant $t$, the abscissa of the center of mass $G$ of $(B)$ is $x$ and the algebraic measure of its velocity is v .
During the motion of $(B)$ between $t_{0}=0$ and $t=\frac{T_{0}}{2}\left[T_{0}\right.$ is the proper period of the oscillations of (B)], an appropriate system traces the graphs of documents (3) and (4).

Document (3): represents the variation of the speed of $G$ as a function of time.
Document (4): represents the variation of the speed of $G$ as a function of the abscissa $x$.
2-1) Determine, by referring to document (3), the value of the maximum kinetic energy of (B).
2-2) Deduce the value of the maximum elastic potential energy of the system [(R), (B), Earth].

2-3) Indicate, by referring to document (4), the value of $\mathrm{X}_{\mathrm{m}}$.
2-4) Deduce the value of $k$.
